V, K: As a rule, V magnitudes are from the *Simbad* database, if source is variable the maximum is shown. Suffixes *p* or *b* stand for photographic or B magnitudes, while a question mark denotes missing data. For what concerns K magnitudes, they also are extracted from the *Simbad* database unless one of the following suffixes is present:

a)   the magnitude is an estimate obtained for the typical V-K of the given spectral type;
b)   estimate derived from the signal level during the occultation event;
c)   photometric measurement shortly preceding or following the occultation event.

Spectrum: Spectral types are from *Simbad*. The luminosity class is III unless otherwise specified. When different determinations of the spectral type exist, the second type follows in parentheses or separated by a slash sign. When the spectral type is variable, types at maximum and minimum are reported separated by an hyphen.
